Does control of animal infectious risks offer a new international perspective?
ABSTRACT

Since 2004, the ENVA has worked in partnership with the CIRAD to develop a distance learning course in basic epidemiology for animal diseases. The current method is based largely on a handbook on veterinary epidemiology which was adapted to suit computer assisted learning sessions. During several training workshops in AI epidemi-surveillance organised by the FAO for Southeast, East and South Asia, Africa, East Europe and Middle East, RANEMA was used as a supplement to increase the impact of the training. This was a new interactive and recreational way to acquire bases in epidemiology. Although RANEMA is a stand-alone tool, the use of the complete set of training material has been maximised by the organisation of a specific training of trainers. Such training was organised by the OIE Regional Representative for Asia and the Pacific in July 2006 for nine countries of Southeast Asia. Ranema is also used at Chulalongkorn University to train veterinary students in epidemiology. New modules are under development e.g. RANEMA-Flu for applying specific recommendations on AI surveillance and control, basic statistics, risk analysis. Evaluation of the efficacy and impact of these trainings should be undertaken by means of surveys in involved countries and/or by a regional meeting. Keywords: Epidemiology, Computer Assisted Learning tool, Regional Workshop, Training

INTRODUCTION

Since 2004, Cirad (Centre de coopération internationale en recherche agronomique pour le développement) has worked in partnership with the Ecole nationale vétérinaire de Maisons-Alfort (ENVA) to develop a...
computer assisted learning (CAL) course in basic epidemiology for animal diseases (namely RANEMA) (Arnone et al.,). This CAL tool refers to drill-and-practice, tutorial, or simulation activities designed to stimulate and motivate students from developing countries, and offered either alone or as supplements to traditional, teacher-directed instruction. The current method is based largely on a veterinary epidemiology handbook (Toma et al., 1999) which was adapted to suit the CAL sessions.

MATERIALS AND METHODS

The CAL sessions were programmed in E-learning Maker 2.5.0 (produced by E-doceo) a development application for creating interactive software. The interface was originally designed in consultation with a graphic designer and epidemiologist. The story board of RANEMA is based on three important pedagogical rules:

- if you want acquisition of knowledge, the contents of the training tool must be in adequacy with the needs and the personal background of the trainees (objective, volume, level, work activities...);
- if you want the trainees to take the tool in its full meaning, it must captivate him, exploit his affects, be held as a movie of which he is the hero;
- the trainee has to establish interaction between problems asked and his own knowledge, and then exploit acquired competences. It is why each activity should answer specific training objectives.

The contents of RANEMA are structured around this scenario: the trainee is a veterinarian working for the Veterinary Service of a virtual country named RANEMA. To carry out his professional duties, he must refresh his knowledge in epidemiology through a given set of activities. The course is divided into chapters that follow the logical framework of the book (figure 1). Several activities based on real life situations are proposed to the trainees:

- drag and drop exercises (in which the student drags the correct answer into the correct box or into a gap in the test);
- calculations that must be performed with the answer entered at the appropriate place.

RANEMA can be used as a CAL tool to reduce traditional lecture time and leave time to focus on tutorials concerning problem areas and more in-depth discussions of specific topics or as a distance-learning training support in basic epidemiology.
Chapter 0
Lesson 0: Presentation of Ranema
Lesson 1: Reminder on definitions

Chapter 1
Lesson 1: The different type of epidemiology
Lesson 2: How to measure disease frequency
Lesson 3: Incidence/Prevalence

Chapter 2
Lesson 1: Sensitivity and specificity
Lesson 2: Prediction of results

Chapter 3
Lesson 0: Basic statistics
Lesson 1: Sampling
Lesson 2: Sample size with a quantitative objective
Lesson 3: Sample size with a qualitative objective
Lesson 4: Interpreting results (Chi2 test)

Chapter 4
Lesson 1: Causality
Lesson 2: Factor of causality

Chapter 5
Lesson 1: Standardisation of data
Lesson 2: Sampling (advanced course)
Lesson 3: Interpreting results (t test)

**Additional Chapters**

**DISCUSSION**

In 2005 and 2006, during several training workshops in AI epidemiomonitoring organised by the FAO for Southeast, East and South Asia, Africa, East Europe and Middle East, RANEMA was used as a supplement to increase the impact of the training (Chavennac et al., 2005). This was a new interactive and recreational way to acquire bases in epidemiology. During the course of the workshops, training needs to improve skills and capabilities of the field or laboratory staff in epidemiology and surveillance were clearly expressed and many participants asked to use the tutorial to organise training in epidemiology once back in their country. Although RANEMA is a stand-alone tool, the use of the complete set of training material (CD + book + complementary exercises + pedagogic guidelines) has been maximised by the organisation of a specific training of trainers. Such training was organised by the OIE Regional Representative for Asia and the Pacific in July 2006 for eight countries of Southeast Asia (Goutard and Molia,
Participants with sufficient knowledge in epidemiology were identified and targeted to be trainers in their country after having received a specific training of 5 days on how to use this pedagogic teaching-case and how to conduct a clearly determined training sequence.

CONCLUSION

New modules are under development – e.g. RANEMA-Flu for applying specific recommendations on AI surveillance and control, basic statistics, risk analysis, use of software for epidemiologists, etc. – and are currently tested during new training session in Asia funded by OIE in Indonesia, Philippines, Myanmar, Malaysia and Thailand.

Evaluation of the efficacy and impact of this trainers’ training should be undertaken one year after this first session by means of surveys in involved countries and/or by a regional meeting.
