EuroSciPy 20010, Paris, 8-11 July 2010

OpenAlea Goals

OpenAlea is an open source platform for modelling plant development and functionning at different scales.

Sharing knowledge

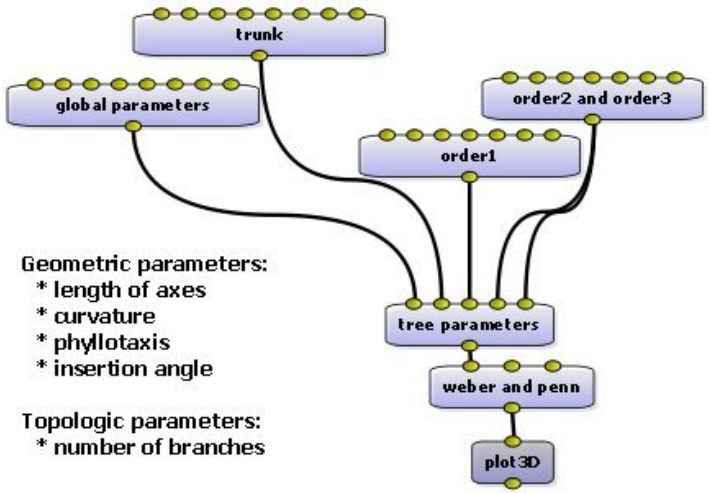
- Reuse software and tools
- Share development between various labs
- Share database and training effort

Common software platform

- Integration of existing software & tools
- Rapid development of new models
- Enhance accessibility
- Quality rules

Design choice

- Open Source scientific community
  - Distributed development (sprints)
- Language centric (Python)
  - Common modelling language
  - Glue language
- Component architecture
  - Dynamic composition
  - High-level dataflow approach
- Visual programming (**VisuAlea**)
  - Graphical model representation
  - Automatic GUI generation
- Shared deployment tools
  - Build, packaging, installation, distribution, update



Visual Programming

Visual Programming Environment

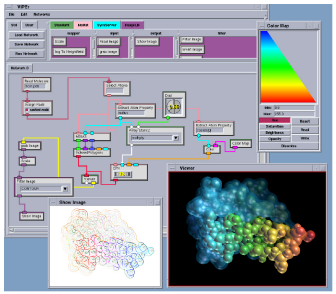
LabView, VTK, Vision, Orange, VisTrails, ...

Advantages

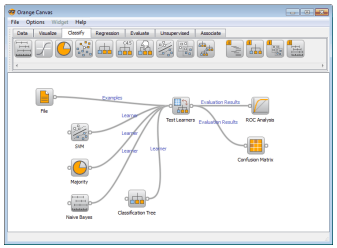
- Interactive creation and modification of flexible workflow
- Visual representation of the structure of a model
- Dynamic composition of software components

Drawbacks

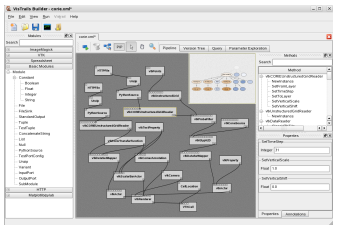
- Less expressive than textual languages (for, while)



Vision (Sanner *et al.*, 2002)



Orange (Demsar *et al.*, 2004)



VisTrail (Freire *et al.*, 2005)

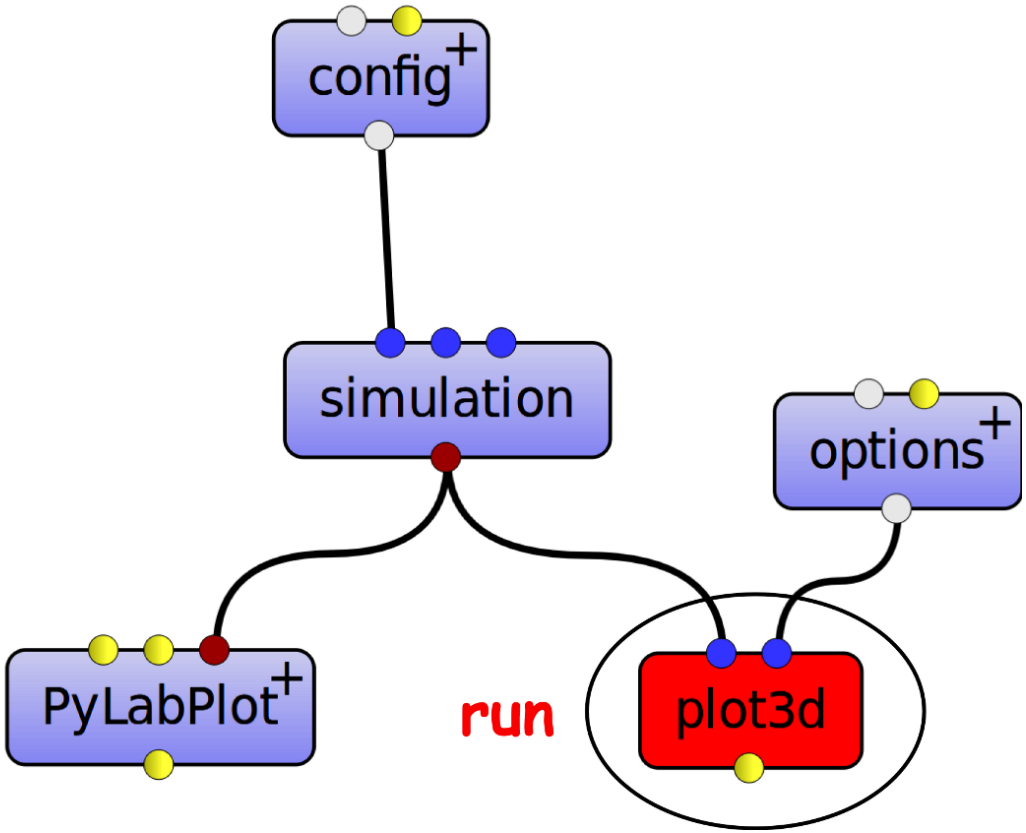
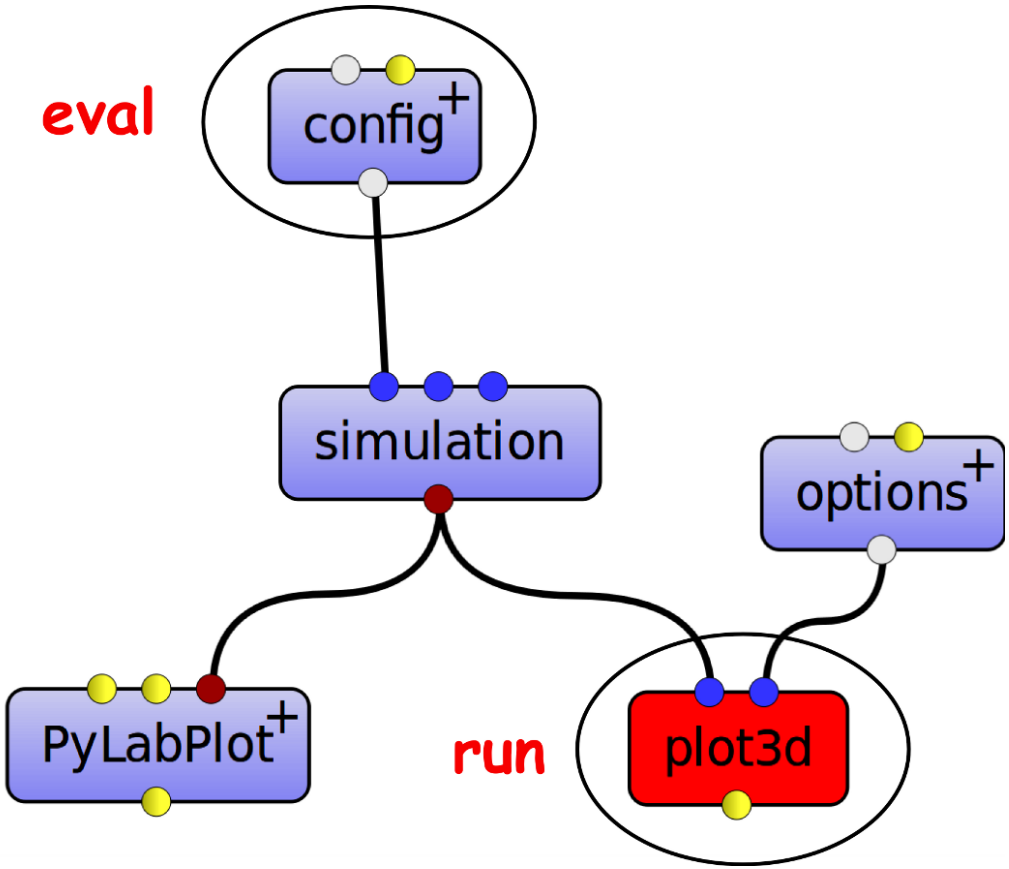
Dataflow Evaluation

Demand driven evaluation



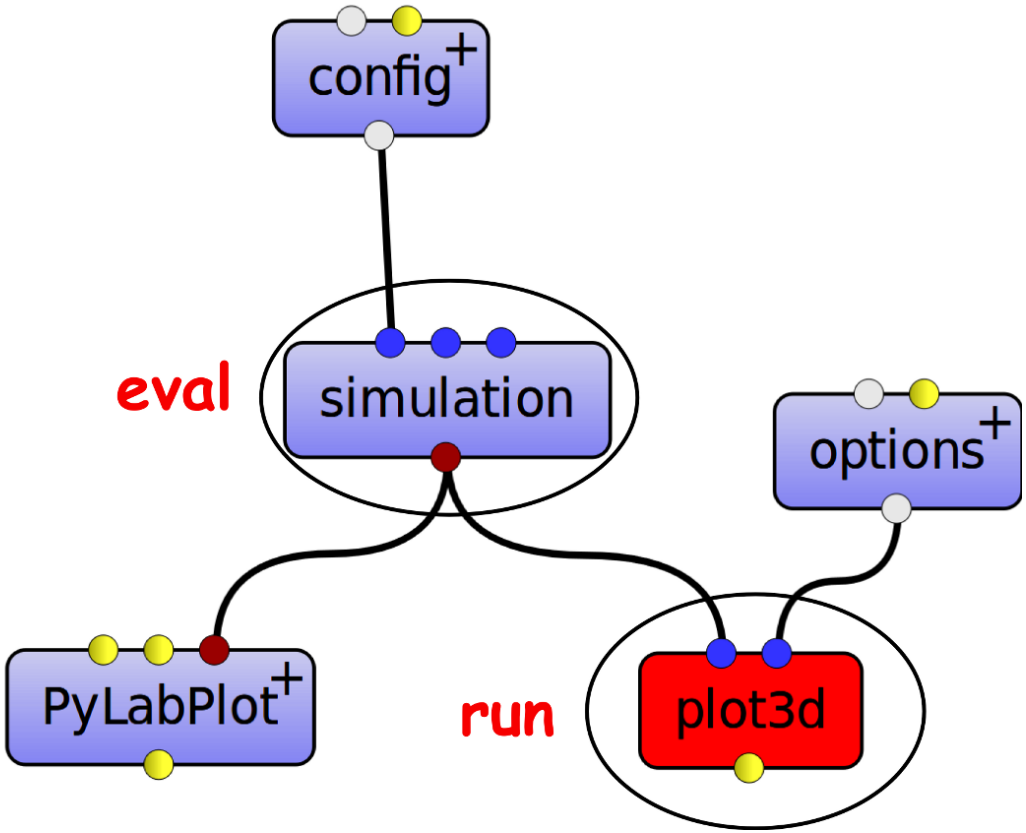
Dataflow Evaluation

Demand driven evaluation



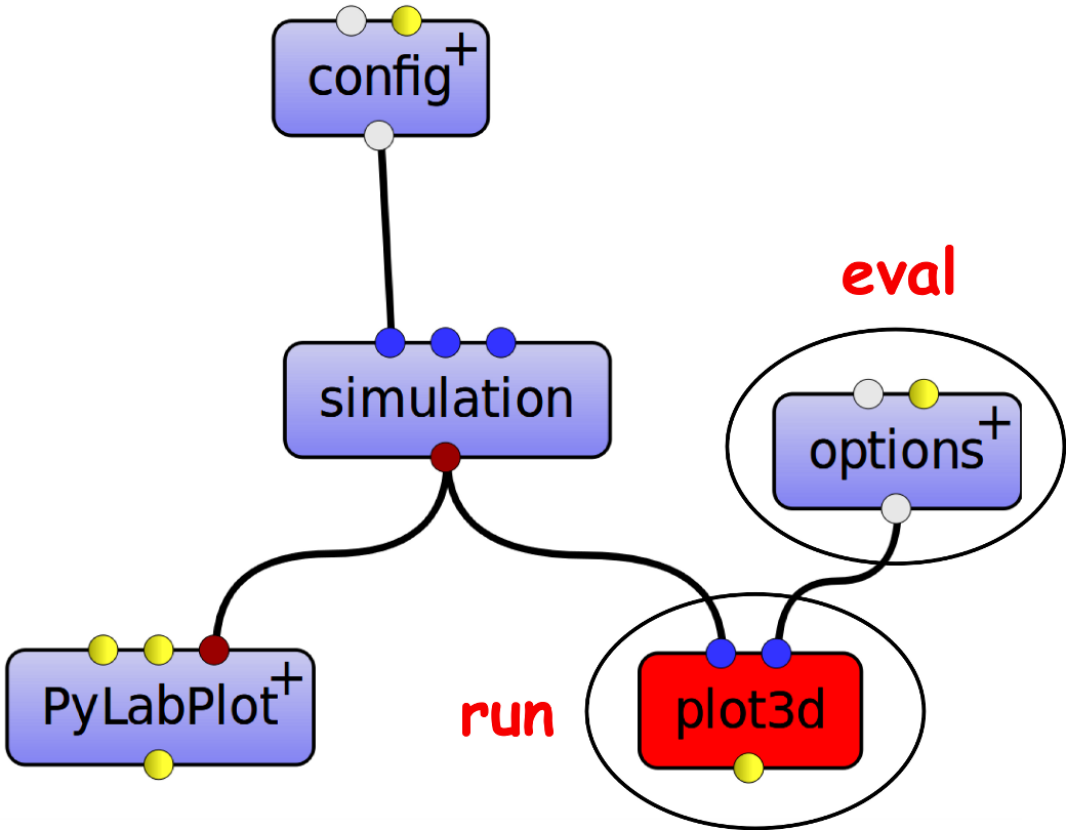
Dataflow Evaluation

Demand driven evaluation



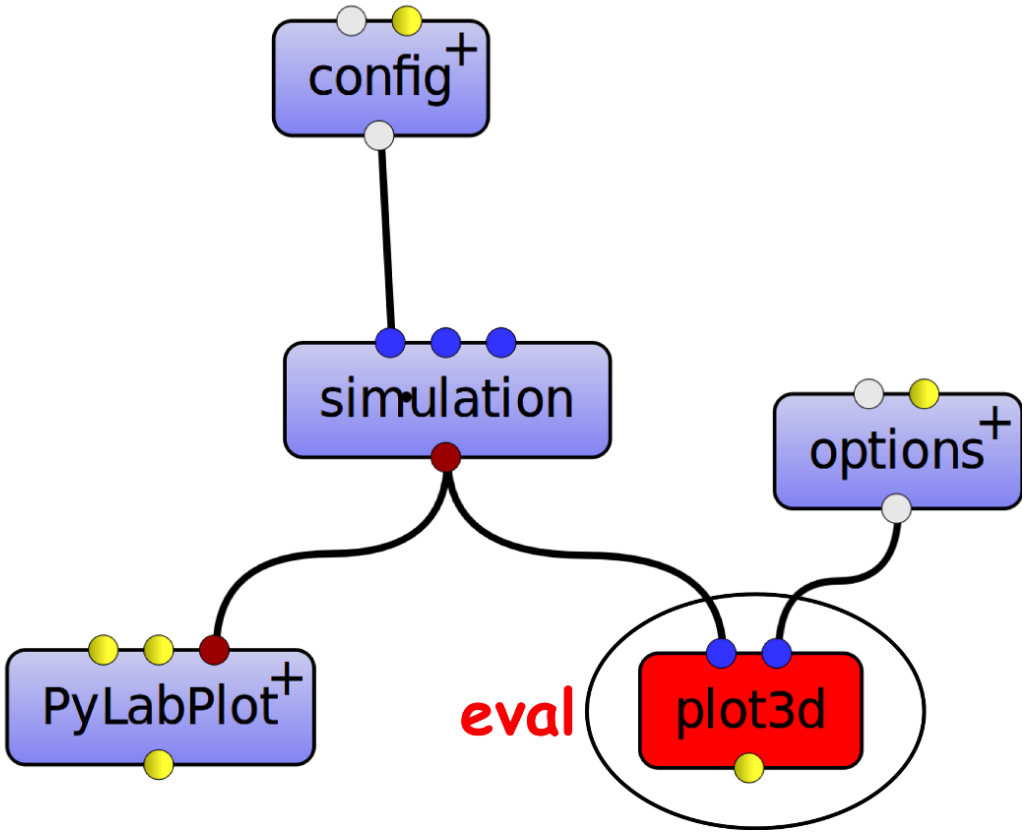
Dataflow Evaluation

Demand driven evaluation



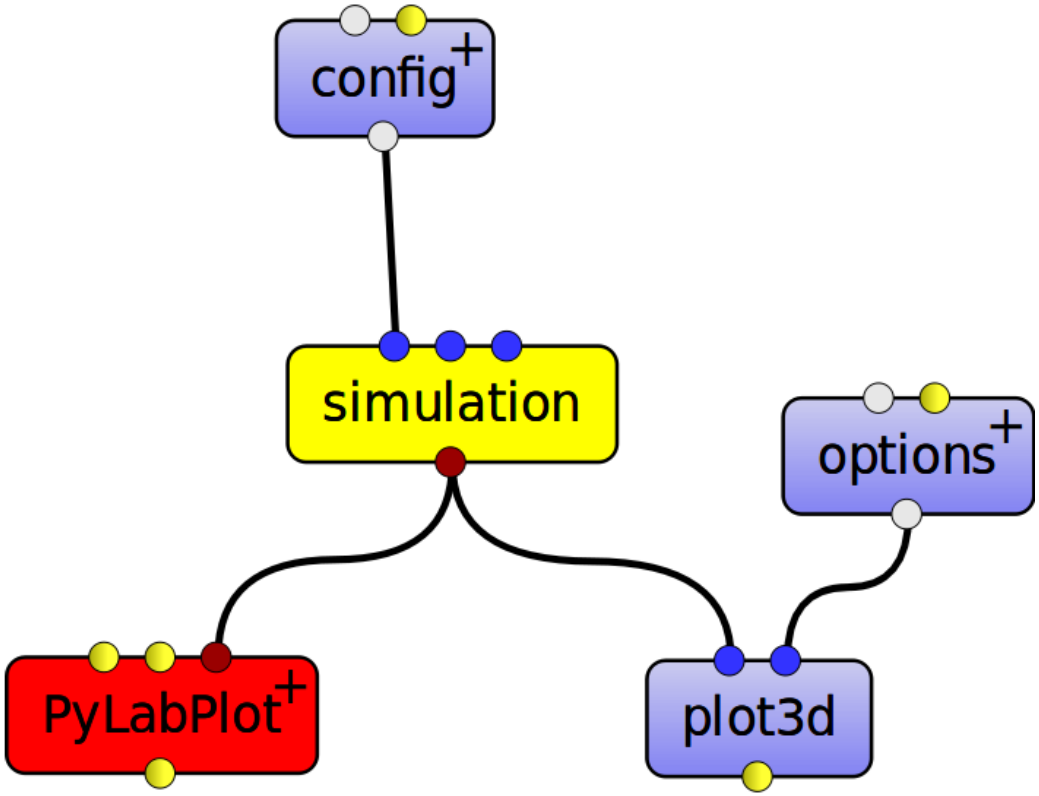
Dataflow Evaluation

Demand driven evaluation



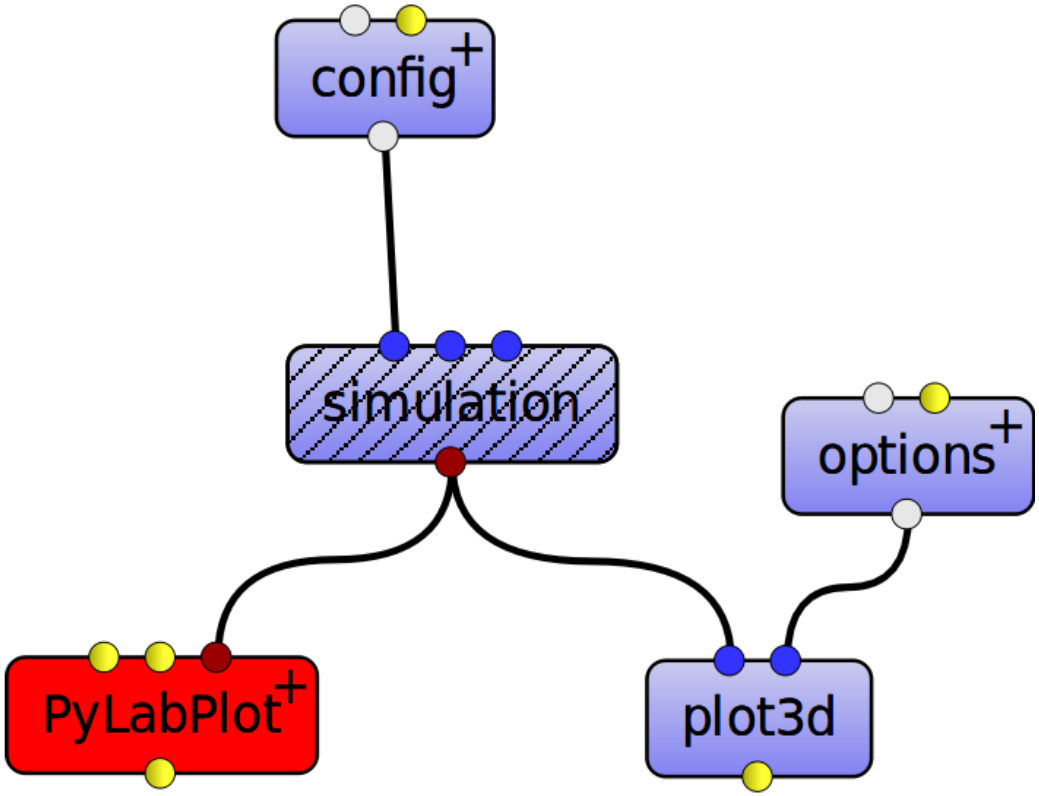
Dataflow Evaluation

Lazy node: re-evaluated only when one of its inputs has changed



Dataflow Evaluation

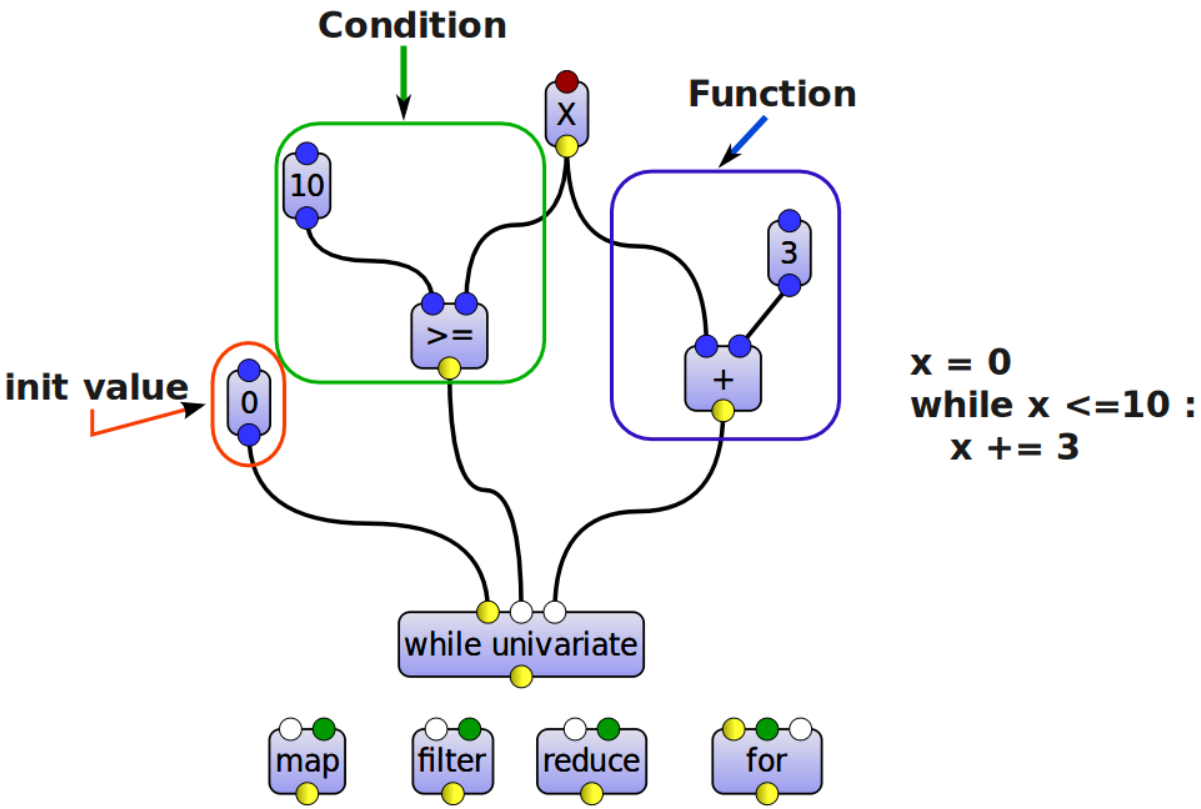
Block node: do not propagate the evaluation



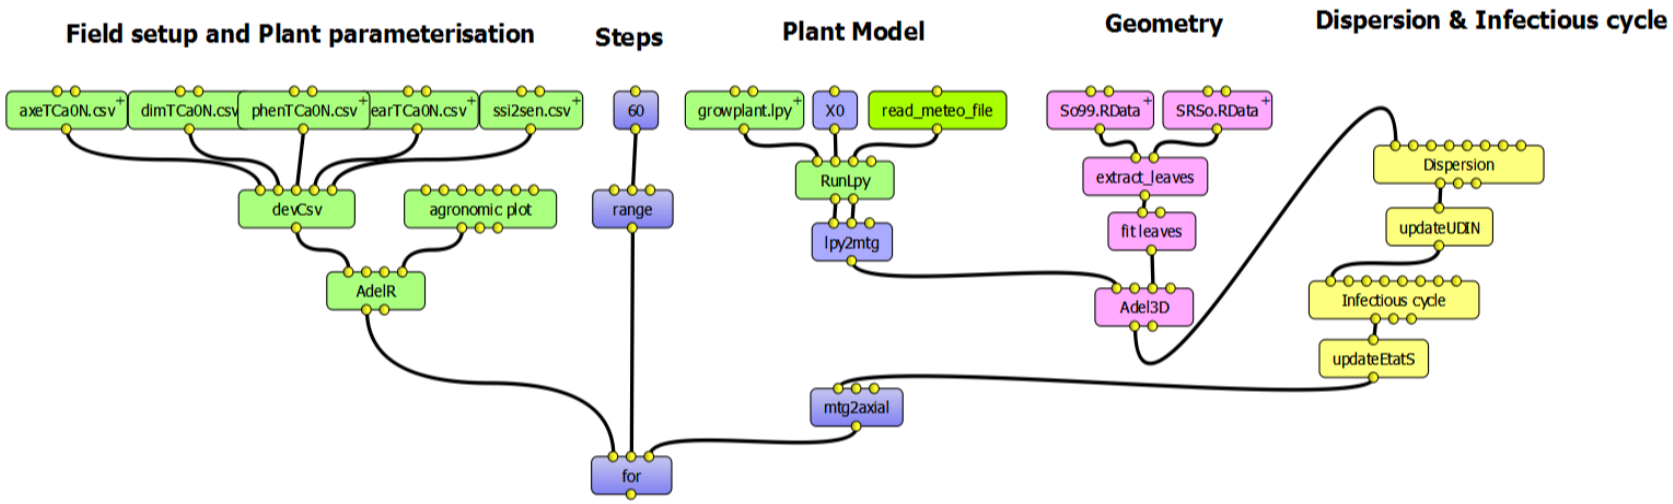
Dataflow Evaluation

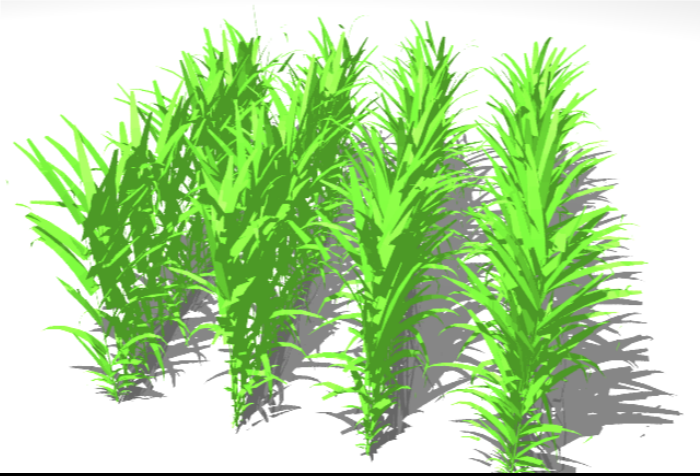
Dataflow = no side effect + no cycle.

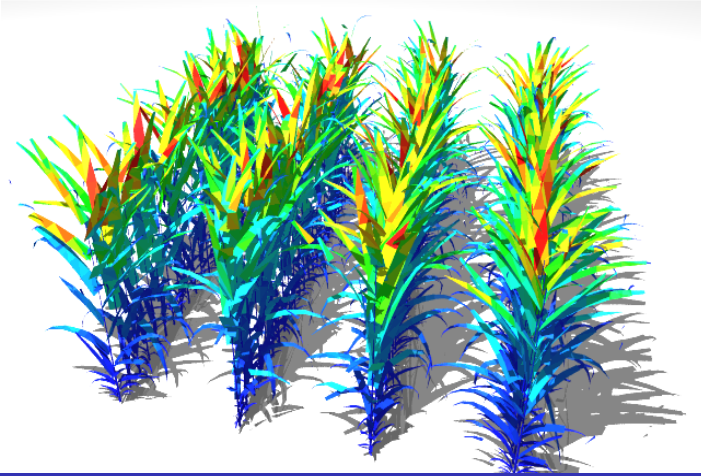
X node: transform a sub-dataflow into a **lambda** function



Example: simulation of plant/disease interaction



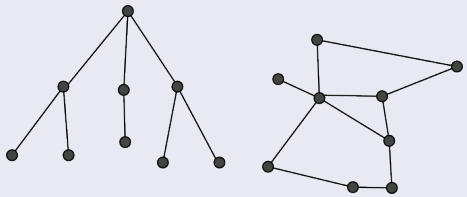




GraphEditor

Need for a **reusable python library** to **view and edit** (m)any **different graph types**, with support for **PyQt4**.

Concepts

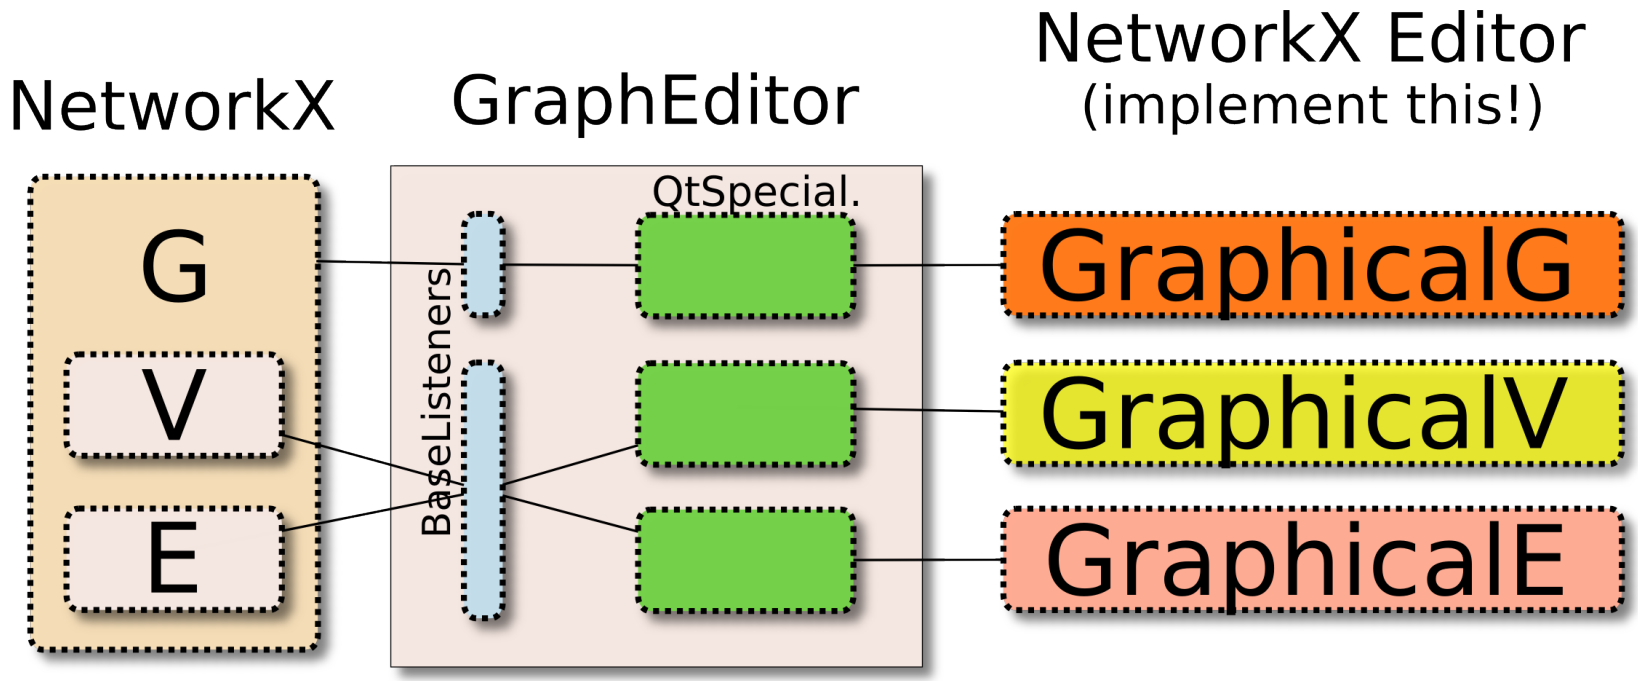


Trees, networks, dataflows (etc ...) boil down to G = { V, E } so
GraphicalG = { *GraphicalV*, *GraphicalE* }

GraphEditor

- Simplifies the implementation of custom graph editors
- Both aspect and interaction are customizable
- Has a PyQt4 implementation of the basic API

Example: Building an editor for NetworkX



The user implements a strategy to view the data

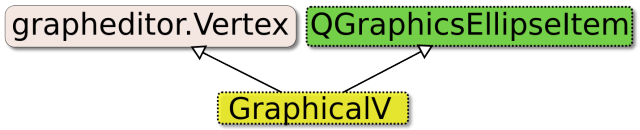
Example: Building an editor for NetworkX

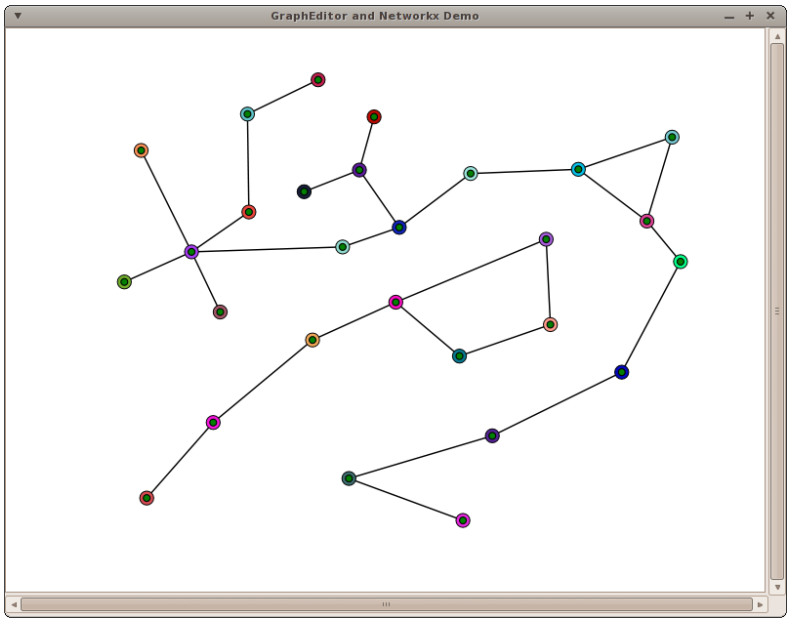
Implement a simple vertex representation

```
class GraphicalVertex(Vertex, QGraphicsEllipseItem):
  def __init__(self, vertex, graph):
    QGraphicsEllipseItem.__init__(self, 0, 0,
                                  20, 20, None)
    Vertex.__init__(self, vertex, graph,
                    defaultCenterConnector=True)
    self.initialise_from_model()
```

```
  def initialise_from_model(self):
    ''' Read the properties stored in the NetworkX
    graph that can be useful for the view. '''

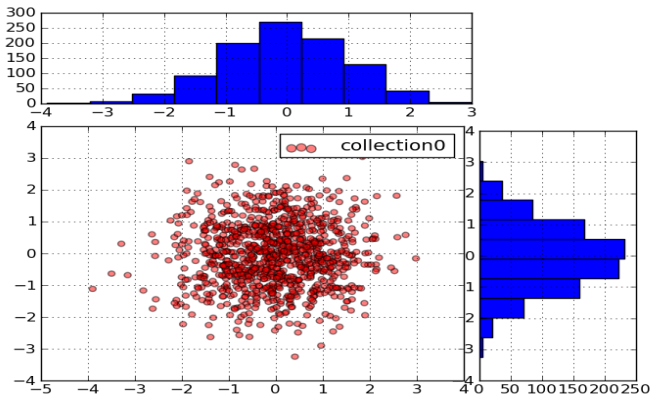
    # Define the position of the vertex in the view
    self.setPos(self.node()['position'])
    # Define the color of the vertex in the view
    color = self.node()['color']
    self.setBrush(QBrush(color))
```



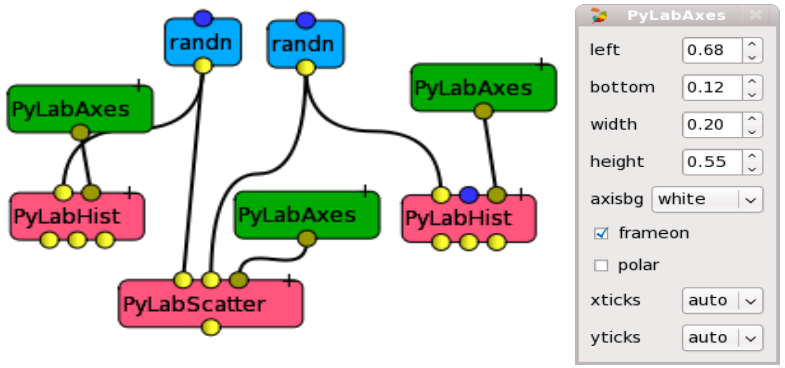


Libraries integration

- In VisuAlea, wrapping/integrating existing librairies into a GUI is made simple.
- Pylab/Matplotlib example: most of Pylab functionalties are available showing the feasability of integrating complex standard librairies into VisuAlea.



PyLab output figure from the dataflow above.



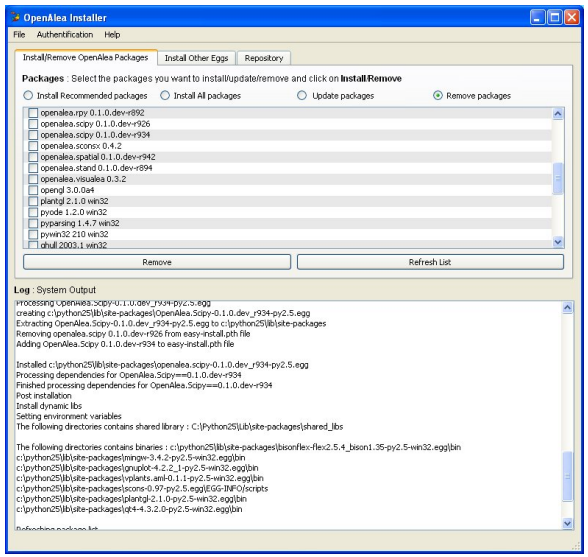
Dataflow that combines scatter and histogram nodes applied on binormal random distribution using Pylab and Numpy functionalities.

- Main advantage: existing options are now accessible as widgets.
- Numpy and Scipy components are integrated on demands.

Deployment and QA

How to distribute large number of binary packages on Mac, Linux, Windows?

- Building & Packaging
  - SCons (C/C++ building) and setuptools: creation of eggs
  - Retrieve the eggs from the web
- Graphical Installer
- Continuous integration (buildbot)
- Automated package creation:
  - SCons files, setup.py, Sphinx conf, ...



Drawbacks

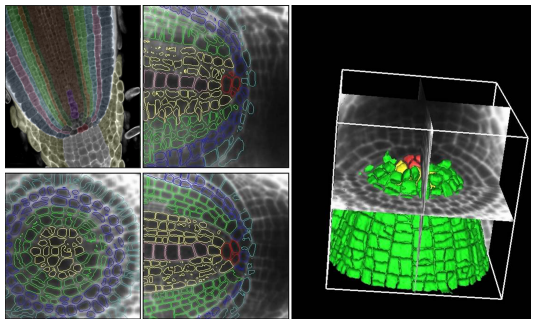
Time consuming and fragile.

Conclusions

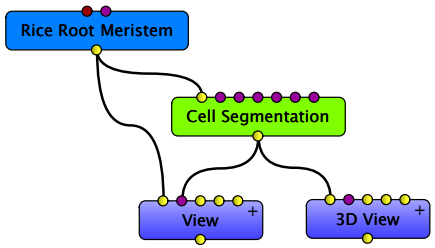
- OpenAlea provides a visual programming environment called VisuAlea
- VisuAlea allows to manage various scientific models in a GUI
  - Foster components/widgets reuse between labs
  - Ease communication
- Recent improvements:
  - Feedback loops using functional programming
  - Graph Editor
  - Many new packages from co-developers: (Biophysics models, image processing, ...)

Perspectives

- Integration of image processing algorithms and visualization tools
  - Registration
  - Fusion
  - Automated cell segmentation
  - Lineage computation
- Parallelization
- Reproductible dataflow simulation



Cells Segmentation and visualization in a rice root meristem (Fernandez *et al.*, Nature Methods, 2010)



Dataflow using a segmentation algorithm and visualization tools
