CHARACTERIZATION OF COCOA AGROFORESTRY SYSTEMS
AND EVALUATION OF THEIR SUSTAINABILITY:
THE CASE OF CENTER CAMEROON

P. JAGORET,
I. MICHEL
and E. MALEZIEUX
(i) The oldest cocoa production region of Cameroon is the Center-South basin where cocoa trees are usually grown with many forest and fruit trees species (Shannon index value around 3).

(ii) A large part of the cocoa orchard contains very old, yet still active, cocoa plots, contrary to what is commonly thought.

(iii) In fact, one usually consider that cocoa cultivation is characterized by a permanent movement of production zones due to difficulties for farmers to replant their old cocoa plantations after 30-40 years.

Lack of sustainability of the main cocoa cropping systems whose level of agrodiversity is usually low.
MATERIALS AND METHODS 1/2
**Experimental design**

Survey (2003) in 742 cocoa farms

- 1142 cocoa plantations
- 316 cocoa plantations (stable area)

**Datas collected**

- Importance of cocoa agroforestry systems in the crop rotation and in the revenue of the farmers
- Age, technical management
- Cocoa density and fermented dried cocoa yields
81% of cocoa plantations are more than 40 years old.

Oldness of the cocoa agroforestry systems of Center Cameroon

Distribution of cocoa plantations per age category (first plantings). Study involving 1142 cocoa plantations of Zima and Ngomedzap study zones.
### Importance of cocoa agroforestry systems for farmers

<td>5 096 (+ 3 152.64)</td>
</tr>
</tbody>
</table>

### Cocoa phytosanitary protection is 5 times cheaper than the usual recommendations

<table>
<thead>
<tr>
<th>Study zones</th>
<th>Cocoa regeneration methods (% of farmers)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Replantation of cocoa plantations</td>
</tr>
<tr>
<td>Zima</td>
<td>94.3</td>
</tr>
<tr>
<td>Ngomedzap</td>
<td>89.1</td>
</tr>
</tbody>
</table>

Regeneration methods allow a progressive renewal of the orchards.
Evaluation of the sustainability of the cocoa agroforestry systems

Study involving 742 cocoa plantations of Zima and Ngomedzap study zones

Density of cocoa trees and cocoa yields are remarkably stable for the long term
(i) Our study confirms the sustainability of the cocoa agroforestry systems of Centre Cameroon.

(ii) The existence of very old and still active cocoa agroforests shows that another cocoa cultivation model is possible and different from the one usually recommended to the farmers, mainly based on a low level of biodiversity and an intensive management of cocoa trees.

(iii) These cocoa agro-forestry systems can certainly be improved to guarantee a better income to the farmers. However they offer a strong alternative to the problem of the conversion of cocoa cropping systems based on the development of pioneer fronts towards more stable and viable cocoa cropping systems.
